Foundations & Clay Soils

Foundations are the base of support for an entire structure. Societies, cultures, cities and homes are all built on foundations. Few people look closely at them until they get a few cracks.

Foundation movement can be one of the most serious challenges you will address when negotiating the sell or purchase of a residential home. This article will not teach you all that is necessary to determine which homes have problems, and which don't. Years and years of knowledge and experience by engineers go into each evaluation that is necessary to make that determination. You can be aware and informed about many of the causes and symptoms of foundation problems, so you are prepared for the questions and challenges that will come your way.

Foundations are built on rock and soil. Geological conditions vary widely around the state of Texas, so there is no way all the peculiarities of some regions could be addressed here.

Enhanced Energy Scans

A home is a big investment and after you make your selection the bills for maintenance and creating a comfortable environment is just beginning. The choice you make can be rewarding or punishing. A good Home Inspection before you close can help you understand what repairs are needed and how to better maintain your new home. Reviewing previous utility bills are a little more difficult to help you determine how energy efficient the home is with your lifestyle.

The current homeowner could work all day and not use any heating or cooling during the day or like their house hotter or cooler than you may like it. You may have children that go in and out numerous times to the pool or even leave the doors open for long periods of time. The challenges are finding a common standard that you can use to measure how energy efficient a house really is and then adapt a lifestyle to utilize the strengths of the house.

Residential houses are built to a specific building code that was adopted by the city when the house was constructed.

Municipal Energy Code Inspection

Municipal Energy Code Inspections are required for all improvements, remodeling, additions and new construction on Commercial and Residential property if they affect the building envelope or involve an energy related construction component. Some cities perform their own Energy Inspections while other cities use approved 3rd party Energy Inspectors. A Closer Look Inspection Service is an approved 3rd party energy inspectors in all cities. The inspection process is generally the same regardless of who performs the Municipal Energy Code Inspections (city inspectors or 3rd party inspectors).

The Municipal Energy Code Inspection replaces the old building code Insulation Inspection with a more detailed inspection of all the energy related components within the construction project. A Closer Look Inspection Service has two separate ACL Energy Handouts (Residential and Commercial) with excerpts from the International Energy Conservation Code (IECC) to help inform you about the specific requirements for each component.
